Chapter 1

Welcome

By using this software you are accepting the terms of the End User License Agreement which is available in the "End User License Agreement DTAPI-TS October 2012.pdf" file provided with this software, or from DekTec by e-mailing info@dektec.com.

1.1 Summary

The DTAPI-TS library allows you to easily integrate transport stream analysis in your own application. You can use it to extract DVB-SI or ATSC PSIP information from a stream like a list of services with their names. The library can even extract some basic information from the underlying elementary streams such as the audio/video codec used, the resolution and the number of audio channels.

1.2 Installation

To install DTAPI-TS you'll need to obtain a license from DekTec first. Once you've got a license in the form of a .dtlic file you can install DTAPI-TS.

1.2.1 Windows

On windows you proceed by running DTAPI-TS.exe. You'll be asked to select the license file you've received and also an output directory. Once you've done this you can click on "Extract DTAPI-TS". The installer will proceed to unpack DTAPITS.h and several .lib files to the directory you picked earlier. The following static link libraries are available:

Filename	#bits	Run-time library	Configuration
DTAPITSMD.lib	32	multi-threaded DLL (/MD)	release
DTAPITSMDd.lib	32	multi-threaded DLL (/MD)	debug
DTAPITSMT.lib	32	multi-threaded (/MT)	release
DTAPITSMTd.lib	32	multi-threaded (/MT)	debug
DTAPITS64MD.lib	64	multi-threaded DLL (/MD)	release
DTAPITS64MDd.lib	64	multi-threaded DLL (/MD)	debug
DTAPITS64MT.lib	64	multi-threaded (/MT)	release
DTAPITS64MTd.lib	64	multi-threaded (/MT)	debug

The correct version of the DTAPI-TS library is automatically linked to the application. This is accomplished with pragma directives in DTAPITS.h. Automatic linking can be disabled by defining `_DTAPI_DISABLE_AUTO_LINK` before including DTAPITS.h.

So, to use a static link library of DTAPI-TS follow these steps:

1. Copy DTAPITS.h and the right version(s) of DTAPITSxxx.lib to your project or to a standard location visible to VC++.
2. Add "#include "DTAPITS.h" to each files that uses DTAPI-TS.
3. Compile your application using compiler settings that match those of the lib file.

1.2.2 Linux

On linux you run the binary InstallDTAPITS from the commandline with as first argument the name of the license file. It'll check if the license is valid and if so, extract DTAPITS.h, DTAPITS.o and DTAPITS64.o to the current directory. To use DTAPI-TS in your application simply include DTAPITS.h in your source file and make sure to include DTAPITS.o (or DTAPITS64.o) in your link step.

The C++11 standard has different versions of the Application Binary Interface (ABI). You can select the CXX11 ABI version by using the `_GLIBCXX_USE_CXX11_ABI` compiler option. If the compiler option is not used, the compiler uses the default setting setted up at compile time of the compiler.

The GCC4.8 libraries are compatible with the CXX11 ABI version 0. The GCC5.1 libraries are compatible with the CXX11 ABI version 1.

If the compiler only supports CXX11 ABI version 0, you should always use the GCC4.8 libraries. If the compiler only supports CXX11 ABI version 1, you should always use the GCC5.1 libraries. If the compiler supports both, you can force the CXX11 ABI version with the `_GLIBCXX_USE_CXX11_ABI` compiler option.

1.3 Usage

DTAPI-TS usage resolves around a few main classes. First you create an instance of the DtTsLib class. Ignore the arguments, they have the correct default values and are there for checking the license. DtTsLib::CreateDtTsInfoInstance() creates an instance of the second main class, DtTsInfo. The next step is to pick the most useful DtTsInfoInput class for your use case. Pick one, create an instance of it and feed it data using the DtTsInfoInput::NewData function. The results of the analysis are in an instance of the DtTsData class which you can find as the m_Data member of DtTsInfo. See also the examples on how to get started.

[inline]

Create a new [DtBitrateSettings](#) object.

Parameters

<i>TimeSliceTime,:</i>	The duration of each time slice.
<i>NumTime-Slices,:</i>	The number of timeslices in the window.
<i>NumAvgValues,:</i>	Each time a new slices is added (and the oldest one removed) from the window, the average value is computed and stored. This parameter indicates the number of averages to store. It can be used to have a longer running average besides the normal average.

9.81.1 Detailed Description

Main [DtapiTs](#) class that is used for setting parameters, adding callbacks, passing in the transport stream buffer (via a [DtTsInfoInput](#) object) and finally reading back the results.

All function calls are thread-safe. Every function automatically acquires/releases an internal lock when the functions starts/exits. You only have to worry about thread-safety when reading or setting any of the member variables if you use another thread to provide the data via a [DtTsInfoInput](#) object. For those cases, call [Lock\(\)](#) before you access any member variable and [Unlock\(\)](#) when you're done. You should try to make sure you don't take the lock for too long. One way to make sure of this is to call [Lock\(\)](#), copy `m_Data` and call [Unlock\(\)](#) directly after. Now you're free to read all data from the copy while another thread can continue processing new packets.

Examples:

[example1.cpp](#), and [example3.cpp](#).

9.81.2 Member Typedef Documentation

9.81.2.1 `typedef DtCallback2<int, const DtPcrJitter&> DtapiTs::DtTsInfo::DtJitterCallback`

Type of a jitter callback function.

A jitter callback function is called as soon as a new vector with jitter offsets is ready.

9.81.2.2 `typedef DtCallback3<const uint8_t*, int, DtTimestamp> DtapiTs::DtTsInfo::DtPacketCallback`

Type of a packet callback function.

Packet callbacks are for every valid transport stream packet. A pid filter is optional. Parameters to the function are:

- Buf: Pointer to a buffer that contains the transport packet.
- BufLen: Size of the buffer with the transport packet. At least 188 bytes.
- Timestamp: Exact time the packet was completely received.

9.81.2.3 `typedef DtCallback3<int, const uint8_t*, int> DtapiTs::DtTsInfo::DtPesCallback`

Type of a PES callback function.

Pes callback functions are called whenever a PES packet is complete. A PES packet is complete when one of the following is true:

- A new PES packet starts in a transport stream packet with the same Pid as indicated by the unit start indicator.
- `m_CompletePes[Pid]==false` and at least 8192 bytes are read.
- `m_CompletePes[Pid]==true` and 8Mb is read. This situation should never occur for a valid transport stream, the PES packet should have been complete and a new one started by this time. The PES callback function gets the following parameters:
- Pid: Pid of this PES stream.
- Buf: Pointer to a buffer that contains the PES packet.
- BufLen: Size of the buffer with the PES packet.

9.81.2.4 `typedef DtCallback3<int, uint8_t, const DtTableSection*> DtapiTs::DtTsInfo::DtSectionCallback`

Type of a section callback function.

Section callbacks are called whenever a section of a table is completely received. At this point no checks have been made to see if a cached version is exactly the same, so you will receive duplicates. Parameters to the function are:

- Pid: The PID on which this section was received.
- TableId: Table identifier of this section.
- Section: Pointer to an object containing the actual data in the table section.

9.81.2.5 `typedef DtCallback3<DtSubTableId, const DtTable*, bool> DtapiTs::DtTsInfo::DtTableCallback`

Type of a table callback function.

Table callbacks are called whenever all sections of a table have been received. The `Changed` parameter indicates whether any part of the table has been changed. This makes it very easy to only filter out updates (ignore any call where `Changed==false`) or to look for repetition rates (don't use the `Change` parameter). The following parameters are passed to the callback function:

- TableId: Unique table identifier for the table.

See Also

[DtSubTableId](#).

- Table: Object that links to all sections in this table which in turn contain the actual data.
- Changed: True if any data byte has been changed, false otherwise.

If you don't fill out [DtSubTableId](#) completely the fields set to -1 will be taken as "don't care". This means that you can set [DtSubTableId::m_TableId](#) to 2 to register a callback for all PMTs.

9.81.2.6 `typedef DtCallback2<DtSubTableId, DtTimestamp> DtapiTs::DtTsInfo::DtTableTimeoutCallback`

Type of a table timeout callback function.

Table timeout callbacks are called when the specified table has not been seen for a certain period (adjustable in `m_TableTimeoutCb`). The following parameters are passed to the callback function:

- TableId: Unique table identifier for the table.

See Also

[DtSubTableId](#).

- Timestamp: Timestamp the timeout has been noticed.

9.81.3 Member Function Documentation

9.81.3.1 `virtual void DtapiTs::DtTsInfo::AddJitterCallback (int Pid, DtJitterCallback Callback) [pure virtual]`

Register a new callback function to be called when more jitter values are ready for PCRs on a specific pid.

9.81.3.2 `virtual void DtapiTs::DtTsInfo::AddNewSectionCallback (int Pid, uint8_t TableId, DtSectionCallback Callback) [pure virtual]`

Register a new callback function to be called when a new section of a given table on a specific PID arrives.

9.81.3.3 `virtual void DtapiTs::DtTsInfo::AddPesPacketCallback (DtPesCallback Callback) [pure virtual]`

Register a new callback function to be called when a PES packet is complete.

If `m_CompletePes[Pid]` is set to false (the default), the callback will be called with a maximum of 8192 bytes of data, if it's set to true the callback will be called only with complete PES packets.

9.81.3.4 `virtual void DtapiTs::DtTsInfo::AddPesPacketCallback (int Pid, DtPesCallback Callback) [pure virtual]`

Register a new callback function to be called when a PES packet on the specified PID is complete.

If `m_CompletePes[Pid]` is set to false (the default), the callback will be called with a maximum of 8192 bytes of data, if it's set to true the callback will be called only with complete PES packets.

9.81.3.5 `virtual void DtapiTs::DtTsInfo::AddTableChangedCallback (DtSubTableId Key, DtTableCallback Callback) [pure virtual]`

Register a new callback function to be called when the table with the given TableId is updated.

9.81.3.6 `virtual void DtapiTs::DtTsInfo::AddTableTimeoutCallback (DtSubTableId Key, DtTableTimeoutCallback Callback) [pure virtual]`

Register a new callback function to be called when the table with the given TableId is not seen for a certain time.

9.81.3.7 `virtual DTAPI_RESULT DtapiTs::DtTsInfo::GetIsdbtPars (DtIsdbtPars & Pars) [pure virtual]`

Retrieve the ISDB-T parameters as they have been found in the TMCC data in the stream.

Parameters

out	<i>Pars</i>	ISDB-T parameters as found in the transport stream.
-----	-------------	---

Returns

DTAPI_OK if there are valid parameters, DTAPI_E_* otherwise.

9.81.3.8 `virtual void DtapiTs::DtTsInfo::Lock () [pure virtual]`

Acquire a lock that makes it safe to access all public data members.

To access any data member while data is processed from another thread you'll have to acquire the lock first. All [DtTsInfoInput](#) classes will acquire the lock before calling NewPacket/NewTimestamp.

9.81.3.9 `virtual void DtapiTs::DtTsInfo::NewPacket (uint8_t * Buf, int BufLen, DtTimestamp Timestamp) [pure virtual]`

Called when a new packet is available.

You should not call this function directly but instead use one of the [DtTsInfoInput](#) subclasses to handle it for you.

9.81.3.10 `virtual void DtapiTs::DtTsInfo::NewTimestamp (DtTimestamp Timestamp) [pure virtual]`

Called periodically to handle timeouts if case no packets are available.

You should not call this function directly but instead use one of the [DtTsInfoInput](#) subclasses to handle it for you.

9.81.3.11 `virtual void DtapiTs::DtTsInfo::Reset () [virtual]`

Reset all data except for the TR 101 290 error status and count.

If you want to reset those also call `m_DvbErrs.ResetAll()`.

9.81.3.12 `virtual void DtapiTs::DtTsInfo::SetJitterWindow (DtTimeDiff TimeDiff, int Multiplier) [pure virtual]`

Change the window used for jitter calculations, default = 1s, 10.

The first value is the update frequency (how often the jitter values in [DtPidInfo](#) are updated and how often any jitter callback is called). The second window is a multiplier for the Timediff increasing the window used for the linear regression test.

9.81.3.13 `virtual void DtapiTs::DtTsInfo::SetStandardMode (DtStandardMode NewMode) [pure virtual]`

Change the standard mode.

Note

Since the way to parse the service information completely changes, this function will internally reset the state and also the TR 101 290 error status/count if the mode actually changes. It's recommended to set the mode only once and before starting the data input.

Examples:

[example1.cpp](#), and [example3.cpp](#).

9.81.3.14 `virtual void DtapiTs::DtTsInfo::Unlock () [pure virtual]`

Release the lock that makes it safe to access all public data members.

Call this function after you're doing setting any parameters below or reading `m_Data`.

9.81.4 Member Data Documentation

9.81.4.1 `bool DtapiTs::DtTsInfo::m_CompletePes[DT_NUM_PIDS]`

Set to true if you want complete PES packets to be cached (and given to the PES callback).

The default is to cache only the first 8kb from each PES packet to save memory.

9.81.4.2 `DtTsData DtapiTs::DtTsInfo::m_Data`

The data extracted from the transport stream.

Examples:

[example3.cpp](#).

9.81.4.3 `std::vector<std::string> DtapiTs::DtTsInfo::m_PreferredLanguages`

List of languages that should be preferred.

This variable is used when the transport stream offers one string in multiple languages (for example the network name or a service component description). The earlier in this list the higher the preference given. Members should

be strings of exactly 3 characters long. See ISO 639-2 for valid language codes. List of preferred languages in order.

9.81.4.4 DtTimeDiff DtapiTs::DtTsInfo::m_TableTimeoutCb[DT_NUM_TABLES]

Duration before a table times out and the corresponding callback should be called.

The parsed and raw data of this table will still be available until the timeout specified in m_TableTimeoutEraseData also runs out.

9.81.4.5 bool DtapiTs::DtTsInfo::m_UseTableCache[DT_NUM_TABLES]

Used to enable/disable the table cache for certain tables.

Example Documentation

10.1 example1.cpp

Small example program that attaches to a DekTec input port, reads the available stream and feeds it to DTAPI-TS to get the network and program names. It'll keep reading data from the input port until you press any key to exit the application. Every 5 seconds the network name and all program names will be printed to the console.

// not
// DTAPI_OK, an error message will be printed to the console and the
// application
// will exit. Please note that there is a memory leak (DtTsInfo* Info and
// DtTsInfoInput* InfoInput are never cleaned up in case of an error) but since
// the memory will be freed when the application exits it's no problem in this
// case.
